(A) In the case of gold alloys, you might wonder where the silver atoms go.

(B) But if you alloy gold, by adding a few per cent of other metals, such as silver or copper, you not only change the colour of the gold - silver making the gold whiter, and copper making the gold redder- you make the gold harder, much harder.

(C) Gold is another relatively soft metal, so much so that rings are very rarely made from pure gold metal because they quickly scratch.

(D) The answer is that they sit inside the gold crystal structure, taking the place of a gold atom, and it is this atom substitution inside the crystal lattice of the gold that makes it stronger.

(E) This changing of the properties of metals by very small additions of other ingredients is what makes the study of metals so fascinating.
